iv) Dermal exposure														

Section A2.10 Annex Point IIA, II.2.10	Exposure data in conformity with Annex VIIA to Council Directive 92/32/EEC (OJ No L, 05.06.1992, p. 1) amending Council Directive 67/548/EEC																										
2. Non-professional Users including the general public	<p>The spinosad fly bait is not intended to be used by the general public; the only user will be the professional farmer.</p> <p>GF-739 is a granular insecticide used in farm buildings. Therefore, since such premises are not occupied exposure of residents is not considered. Individual workers may enter treated premises for routine tasks and could come into contact with surface deposits of GF-739. However, exposure of such workers will be limited and can be expected to be considerably lower than those who applied the product. The calculations above demonstrate that exposure of operators to spinosad is below the AOEL for operators not wearing protective gloves. Therefore, the risk to other workers is considered to be very low.</p>																										
(i) via inhalation contact	Inhalation exposure arising from application of GF-739 would be negligible either applied as a granule or after spray dry. Spinosad is a non-volatile active substance (vapour pressure $2.0 - 3.0 \times 10^{-11}$ kPa at 25°C, IIIA 3.2, Ref. A01 and A36) and GF-739 is a non-dusty granule (94% particles > 250 µm, Ref. IIIB 3.11/01, MA46).																										
(ii) via skin contact	<p>The impact of contact with the treated surface can be summarized in the following table. This is based on work by Brouwer <i>et al</i> 1999 and assumes transfer from hands to mouth and therefore absorption via the oral route.</p> <table border="1" data-bbox="518 1088 1294 1532"> <thead> <tr> <th></th> <th>Child</th> <th>Adult</th> </tr> </thead> <tbody> <tr> <td>spinosad residue on treated surface (mg cm⁻²)</td> <td>0.0025</td> <td>0.0025</td> </tr> <tr> <td>dislodgeability of residues from treated surface = 2 % (mg cm⁻²)</td> <td>0.0001</td> <td>0.0001</td> </tr> <tr> <td>40 % of area of both palms contaminated (cm²)</td> <td>113.4</td> <td>168</td> </tr> <tr> <td>amount of spinosad residue on both palms = amount of spinosad ingested (mg)</td> <td>0.0113</td> <td>0.0168</td> </tr> <tr> <td>body weight (kg)</td> <td>36.3</td> <td>60</td> </tr> <tr> <td>Systemic exposure to spinosad via oral route (mg kg⁻¹)</td> <td>0.0003</td> <td>0.00028</td> </tr> <tr> <td>% of AOEL</td> <td>1.25</td> <td>1.17</td> </tr> </tbody> </table> <p>Direct absorption via the skin would be even lower because of the lower efficiency of absorption via the skin.</p>			Child	Adult	spinosad residue on treated surface (mg cm ⁻²)	0.0025	0.0025	dislodgeability of residues from treated surface = 2 % (mg cm ⁻²)	0.0001	0.0001	40 % of area of both palms contaminated (cm ²)	113.4	168	amount of spinosad residue on both palms = amount of spinosad ingested (mg)	0.0113	0.0168	body weight (kg)	36.3	60	Systemic exposure to spinosad via oral route (mg kg ⁻¹)	0.0003	0.00028	% of AOEL	1.25	1.17	
	Child	Adult																									
spinosad residue on treated surface (mg cm ⁻²)	0.0025	0.0025																									
dislodgeability of residues from treated surface = 2 % (mg cm ⁻²)	0.0001	0.0001																									
40 % of area of both palms contaminated (cm ²)	113.4	168																									
amount of spinosad residue on both palms = amount of spinosad ingested (mg)	0.0113	0.0168																									
body weight (kg)	36.3	60																									
Systemic exposure to spinosad via oral route (mg kg ⁻¹)	0.0003	0.00028																									
% of AOEL	1.25	1.17																									
(iii) via drinking water	Not applicable, the baiting process does not involve application methods that will result in drift or off site movement or leaching.																										
(iv) via food	Not applicable, since spinosad will not be used on food or feed. Indirect exposure via food is addressed in Section B6.7.																										
via (v) indirect environment	<p>Not applicable:</p> <p>If the product is used correctly and disposed of properly there should be no indirect exposure to the environment because the bait is only used inside of structures (animal housing/stables).</p>																										

<p>Section A2.10</p> <p>Annex Point IIA, II.2.10</p>	<p>Exposure data in conformity with Annex VIIA to Council Directive 92/32/EEC (OJ No L, 05.06.1992, p. 1) amending Council Directive 67/548/EEC</p>	
	<p>However, concern was raised during the national evaluation of this product about possible contamination of manure. Care should be taken that the product does not come into contact with manure for efficacy reasons.</p> <p>If spent fly bait granules are disposed of on manure heaps, the likelihood of residues of spinosad leaching out of the compost are extremely small due to the extremely high sorption constants for spinosad and its primary metabolites (Saunders, D.G. & Powers, F.L.(1994), Soil Adsorption and Desorption of XDE-105 Metabolite Factor B, DowElanco Report No. GH-C 3295, 91/414/EEC, IIA7.1.2/03 Ref. K10 and Saunders, D.G. & Powers, F.L.(1994), Soil Adsorption and Desorption of XDE-105 Factor A, DowElanco Report No. GH-C 3298, 91/414/EEC, IIA7.1.2/02 Ref. K07). The range of Koc values for spinosyn A were 900-139698 mL/g. and for the primary metabolite, spinosyn B were 676-77418 mL/g These values indicate a very low potential for leaching out of manure.</p> <p>No specific study has been conducted with the Flybait product in manure, but there is a study available with the active ingredient Spinosad in a sediment under anaerobic conditions (Reeves, G.L., (1993), The Anaerobic Aquatic Metabolism of [¹⁴C] XDE-105, Dow AgroSciences report No.GHE-P-2989R, 91/414/EEC, IIA7.1.1.1.2/01, Ref. K13). This study is considered relevant to manure because anerobic conditions will occur in manure when it is wet. Once it dries out it would be aerobic. Therefore anaerobic metabolism is best studied under wet (aquatic) conditions.</p> <p>Under flooded anaerobic conditions in a sediment, spinosyns A and D partitioned rapidly from the water to sediment phases and, therefore, would be expected to remain strongly sorbed to the granular support material of the fly bait.</p> <p>Up to six metabolites were observed for spinosyn A and three of these exceeded 10% AR. At least eight metabolites were observed for spinosyn D and only one of these exceeded 10% AR. The HPLC profiles for spinosyn D extracts mirrored those for spinosyn A and the metabolites of spinosyn D were indicated to be the corresponding spinosyn A analogues.</p> <p>The major degradation products of spinosyn A (those exceeding 10% AR) were identified as spinosyn B, spinosyn J and a tentative structure of O-demethylated spinosyn J was proposed for the third major metabolite. Three minor metabolites (<10% AR) of spinosyn A were postulated to be isomers of the reversepseudoaglycone and ketoreversepseudoaglycone.</p> <p>The only metabolite of spinosyn D to exceed 10% AR was tentatively assigned as the spinosyn J analogue of spinosyn D (by analogy with spinosyn A). However, as spinosyn D is the minor component of spinosad (ca. 15-50%), this metabolite will not exceed 10% of the total applied spinosad.</p> <p>Levels of non-extractable residues in sediment reached maximum levels of 15- 17% AR under flooded anaerobic conditions. Production of volatile radioactivity was also low (<1% AR) for both spinosyns.</p>	

Section A2.10 Annex Point II A, II.2.10	Exposure data in conformity with Annex VIIA to Council Directive 92/32/EEC (OJ No L, 05.06.1992, p. 1) amending Council Directive 67/548/EEC	
	<p>Conclusion:</p> <p>The likelihood of indirect exposure to the environment from use of the fly bait granule is extremely low because the bait is only used inside of structures (animal housing/stables). Concern has been expressed over the possible contamination of manure by the disposal of spent granules. Due to the extremely high sorption constant for spinosyn A and its primary metabolites, the risk of leaching of residues from manure is extremely low. Furthermore, under anaerobic conditions, residues of spinosad degrade to between 6 and 8 metabolites of similar structure to the parent materials, which will also have extremely low potential to leach from manure.</p>	
2.10.2 Environment al exposure towards active substance		
2.10.2.1 Production	The biocidal active ingredient is manufactured in the USA. According to the TNsG Data Requirements, Ch.2, 2.10 and 6.6, for products manufactured outside the European Union, no details on production need to be included.	
(i) Releases into water	See above	
(ii) Releases into air		
(iii) Waste disposal		
2.10.2.2 Intended use(s)	Intended use is in product type 18 (insecticide) only.	
Predicted concentration in the affected compartment(s):	<p>Air, water, soil and sediment were calculated according to the Fugacity Model Level I and Level II (refer to Document B7.8).</p> <p>The distribution of spinosad in the environment after use of GF-739 fly bait granule has been assessed using Level I and II fugacity models simulating an environment representative of the EU plus Norway and Switzerland. Based on the results of the modelling, the majority of spinosad released into the environment was predicted to be in the soil compartment (~99 %) and small amounts partitioned to the sediment (~1 %) and air, water, suspended solids, aerosol and fish compartments (<0.04 % in each). Total system fugacity values were in the range 1.62×10^{-17} Pa to 9.62×10^{-22} Pa for both Levels I and II. Equilibrium concentrations estimated at both Levels I and II were low for all compartments (<10^{-3} mg/kg).</p> <p>The results show that spinosad is unlikely to be found in any compartment at significant concentrations.</p>	
water	<0.04 % in each	
sediment	~1 %	
air	<0.04 % in each	
soil	~99 %

Table A2.10.1: Workplace exposure / Inhalation exposure

Exposure scenario	Workplace operation	PPE	Year(s) of measurement	Number of measurements	Type of measurements	Exposure concentration
Production	not applicable, since spinosad is produced [REDACTED]					
Formulation	Formulation of the bait at the plant	Extensive engineering controls are in place to control exposure. Occasional use of PPE may be necessary if an environment becomes dusty.	No specific inhalation exposure measurements have been made for Spinosad. The health of the workforce is monitored regularly and no adverse effects associated with Spinosad have been reported.	-/-	-/-	-/-
Application MG 3 / PT18						
	1. Scattered evenly in animal housing where flies gather (e.g.	None required but gloves	None	None	None	The potential exposure was estimated using the most appropriate model available (US PHED) and an

Exposure scenario	Workplace operation	PPE	Year(s) of measurement	Number of measurements	Type of measurements	Exposure concentration
	window sills, tops of walls, edges of walkways, etc.). 500 g product/200 m ² 0.025 g a.s./m ²)	advised to avoid dyeing of hands				exposure of 1.2% of the AOEL was derived. This exposure would be further reduced as the operator would be recommended to wear gloves to avoid potential staining of the hands.
	2. Placed in bait stations or trays, which are positioned where flies gather. 500g product/200 m ² floor space in a minimum of 10 bait stations (0.025 g a.s./m ²)	None required but gloves advised to avoid dyeing of hands	None	None	None	For placing undiluted product in bait stations/trays and when scattering by hand on to hangboards/cards, it can be anticipated that operator exposure to SpY granules will be far less than for scattering by hand directly to animal house surfaces. Also, it is likely that the duration of exposure will be less. Therefore, it is proposed that total systemic exposure for a 60 kg adult placing the product in bait stations/trays or on to hangboards/card will be < 0.0003 mg kg ⁻¹ d ⁻¹ . i.e <1.2% of the AOEL.
	3. Sprinkled onto moistened hangboards/cards, where flies gather. 100 g product/m ² of board; 25 boards/200 m ² floor space using 5 m ² of boards/200 m ² floor space (0.025 g a.s./m ²)	None required but gloves advised to avoid dyeing of hands	None	None	None	For placing undiluted product in bait stations/trays and when scattering by hand on to hangboards/cards, it can be anticipated that operator exposure to SpY granules will be far less than for scattering by hand directly to animal house surfaces. Also, it is likely that the duration of exposure will be less. Therefore, it is proposed that total systemic exposure for a 60 kg adult placing the product in bait stations/trays or on to hangboards/card will be < 0.0003 mg kg ⁻¹ d ⁻¹ . i.e <1.2% of the AOEL.
	4. Diluted in water and sprayed where flies gather. 500 g	Gloves and FFP2 dust and	None	None	None	The exposure for a professional operator during mixing and application of GF-739 is calculated using 'spraying

Exposure scenario	Workplace operation	PPE	Year(s) of measurement	Number of measurements	Type of measurements	Exposure concentration
	product/1.0 L water; 1 L of diluted product/200 m ² (0.025 g a.s./m ² ; 5 g a.s./L)	liquid aerosol mask.				model 2' as presented in 'Assessment of human exposure to biocides' ¹ . The model estimates the total exposure for mixing/loading and applying liquid remedial timber treatments and surface biocides by pumped sprayer and lance at 4 to 7 bar as a coarse spray indoors, overhead and downwards, and pressure-irrigating masonry. The 75th percentile is considered a conservative value. Higher percentiles or maxima are not appropriate because The top end of the model represents contamination rates arising from use of high pressure hosing of large areas and the operators became visibly drenched over a period of time. It is difficult to imagine these higher rates of contamination arising from this process. The potential exposure was estimated using the most appropriate model and an exposure of 57% of the AOEL was derived using gloves and FFP2 mask.
	5. Diluted with water and painted onto surfaces in areas where flies gather. 500 g product/0.5 L to 1.0 L water; /200 m ² (0.025 g a.s./m ² ; 5 or 10 g a.s./L)	None required but gloves advised to avoid dyeing of hands				Utilizing the Brush painting (includes decanting) from the draft is guidance includes the concepts developed in the report of the Biocides Steering Group (97/505/3040/DEB/E2) and refers to guidance on exposure assessment being developed for New and Existing Substances (NESS) 2002. The potential exposure was estimated using the most appropriate model available and an exposure of 27% of the AOEL was derived.

¹ Report to DGXI from the Biocides Steering Group, October 1998. Project 97/505/3040/DEB/E2. Page E.6.

Exposure scenario	Workplace operation	PPE	Year(s) of measurement	Number of measurements	Type of measurements	Exposure concentration
						<p>However, the following facts indicate that this would be a conservative estimate:-</p> <ul style="list-style-type: none"> ▪ No appropriate model exists for the use of a roller, but it is not unreasonable to deduce that the potential for dermal exposure during application would be less than that from the use of a brush. ▪ Exposure from mixing and loading a GF-739 would be low, in particular inhalation exposure as this formulation is a non-dusty granule (94% particles > 250 µm). The amount of formulation handled would be low (500 g product/200m²) and the size of the granules would result in low retention on the skin. ▪ Inhalation exposure arising from application of GF-739 as a paint would be negligible as spinosad is a non-volatile active substance (vapour pressure 2.0 - 3.0 x 10⁻¹¹ kPa at 25°C, IIIA 3.2, Ref. A01 and A36) and GF-739 is a non-dusty granule (94% particles > 250 µm, Ref. IIIB 3.11/01, MA46). ▪ Therefore the % AOEL based solely on dermal exposure would be 0.35/60 = 0.0058mg/kg/day or 24% of the AOEL. <p><i>This would further be reduced by the use of gloves</i></p>

<p><u>CTB Comments at Completeness Check March 2006:</u> Reference is made to the study of the determination of the decomposition temperature. The identity of relevant breakdown products is not determined in this study. A statement or study is necessary.</p> <p><u>Dow AgroSciences Response March 2006:</u> The study (DAS Ref. A18) entitled "Thermogravimetric Analysis of Spinosad and Evolved Gas Analysis by Gas Chromatography/Mass Spectrometry" DECO GL-AL 96-005553, Froelicher, S.W, Feb 1997 has been submitted. This study provides details of the type of substances evolved from spinosad TGAI after heating to high temperatures > 400 deg C. Data from this thermogravimetric analysis indicated a sample weight loss of about 92% from the sample up to a temperature of 400 deg. Thermal degradation products associated with this weight loss tentatively identified by TG/GC/MS included Carbon dioxide, methyl formate, acetaldehyde, and various sugar fragments of the Spinosad molecule.</p>

CTB Comments at Completeness Check March 2006:
Reference is made to the study of the determination of the flammability and autoflammability (according to EEC method A10 and A16) The identity of combustion products is not determined in this study.
A statement or study is necessary.

Dow AgroSciences Response March 2006:
The flammability test on spinosad (EEC A10) indicated that the material was not flammable. The autoflammability test (EEC A16) on spinosad indicated that the material was not autoflammable and did not self-ignite even up to the maximum temperature of 400°C. We therefore submit that the identity of combustion products from these 2 tests is not relevant or appropriate.
The study (DAS Ref. A18, submitted under 98/8/EC point IIIA3.10)) entitled “Thermogravimetric Analysis of Spinosad and Evolved Gas Analysis by Gas Chromatography/Mass Spectrometry” DECO GL-AL 96-005553, Froelicher, S.W, Feb 1997 has been submitted. This study provides details of the type of substances evolved from spinosad TGAI after heating to high temperatures > 400 deg C.
Data from this thermogravimetric analysis indicated a sample weight loss of about 92% from the sample up to a temperature of 400 deg. Thermal degradation products associated with this weight loss tentatively identified by TG/GC/MS included Carbon dioxide, methyl formate, acetaldehyde, and various sugar fragments of the Spinosad molecule.

B.2.3 Summary of physical and chemical properties

B.2.3.1 Active substance

Physical and chemical properties of the active substance

Spinosad is a mixture of two structurally similar molecules which are both active insecticidally and have been designated spinosyn A and spinosyn D. Spinosad typically contains Spinosyn A and spinosyn D in a ratio of approximately 85 % A : 15 % D.

The pure active substance spinosyn A and D are solids with a melting range from 84 to 99.5 °C for A and 161.5 to 170.0 °C for D. The vapour pressure is low for both isomers.

Spinosyd D is slightly soluble in water (0,33 mg/ml at pH7) while spinosyn A is moderately soluble in water (235 mg/l at pH 7) with some decrease at higher pH values. The log Pow is slightly pH dependable but values higher than 4 at pH 7 and higher pH values indicates that bio-accumulation can occur. Log Pow at pH 7 is for spinosyn A: 4.01 and for spinosyn D: 4.53.

The active substance is very slightly hydrolysing in water (at pH 9) but degradation during radiation with sunlight is very rapidly. The dissociation constant of spinosyn A is pKa is 8.1 and for D, pKa is 7.87.

The technical substance is not classified as flammable, auto-flammable, explosive or oxidising.

CTB Comments during Evaluation August 2007:
The relative density was determined in two different studies as 0.512 or 1.1866 at 20 °C. No explanation was given for this difference in results. However, in an addendum to the 91/414 DAR on pesticides, an explanation was given for this difference. The applicant is requested to update Doc IIIA to reflect the current status of the DAR.

Dow AgroSciences Response August 2007.
The Addendum to the 91/414/EEC Draft Assessment Report of July reflects the current studies conducted. A new study for the relative density was stated because the value in the original study (0.512 at 20°C at 88.0% purity) was not correct. It was apparent that such a low value was inconsistent with what would be expected for a molecule of this molecular weight.

Materials and methods	<p>Section IIIA, several sections:</p> <p>IIIA3.1.1 (melting point), IIIA3.4 (UV/VIS, IR, NMR, MS spectra), IIIA3.5 (solubility in water including effect of pH), IIIA3.6 (dissociation constant), IIIA3.7 (solubility in organic solvents), IIIA3.9 (partition coefficient), IIIA3.13 (surface tension).</p> <p>For several physical-chemical properties, data are available for spinosyn A and spinosyn D, but not for spinosad. Although for some of the physical chemical properties (e.g. melting point and solubility in water) values for spinosad (i.e. active substance) will differ from the individual compounds spinosyn A and spinosyn D, these data will give little additional information. Therefore physical-chemical properties for the individual compounds spinosyn A and spinosyn D are considered sufficient.</p> <p>Vapour pressure and Henry's Law Constant are not available for spinosad, but these are not required because spinosad is a solid substance with an expected vapour pressure <math>10^{-5}</math> Pa at ambient temperature.</p>
Conclusion	Several physical chemical properties for the active substance are not available, but data from the individual compounds spinosyn A and D are considered sufficient.

Materials and methods	Section A3.9 Partition coefficient Spinosyn A is considered surface active (surface tension 41.5 mN/m). The shake flask method is not applicable to surface active substances. The calculated log Kow value (EPIsuite version 3.12) is 5.61 for spinosyn A. The measured value for spinosyn A is 3.91. The measured values for the log Kow can be accepted because the solubility in water is so low that this will have no influence on the log Kow measurement.
Conclusion	no comments

Materials and methods	<p>Section A3.10 (equivalent to B2.1.3 in the 91/414/EC monograph)</p> <p>Thermal stability, identity of relevant breakdown products</p> <p>Reference is made to the study of the determination of the decomposition temperature. The identity of relevant breakdown products is not determined in this study. A statement or study is necessary.</p> <p>Dow AgroSciences Response March 2006: <i>"The study (DAS Ref. A18) entitled "Thermogravimetric Analysis of Spinosad and Evolved Gas Analysis by Gas Chromatography/Mass Spectrometry" DECO GL-AL 96-005553, Froelicher, S.W, Feb 1997 has been submitted. This study provides details of the type of substances evolved from spinosad TGAI after heating to high temperatures > 400 deg C. Data from this thermogravimetric analysis indicated a sample weight loss of about 92% from the sample up to a temperature of 400 deg. Thermal degradation products associated with this weight loss tentatively identified by TG/GC/MS included carbon dioxide, methyl formate, acetaldehyde, and various sugar fragments of the spinosad molecule."</i></p> <p>NL Response April 2006: RMS is satisfied with the answer from DOW.</p>
Conclusion	After heating to high temperatures (up to 400 °C) a weight loss of 92% is observed. Thermal degradation products included carbon dioxide, methyl formate, acetaldehyde, and various sugar fragments of the spinosad molecule

Section A4 (4.1) Annex Point IIA, IV.4.1	Analytical Methods for Detection and Identification 4.1 for the determination of pure active substance	
<p>As described in the “Guidance Document on How to utilize PPP dossiers/monograph” of 21 November 2003 the evaluation of the CA from the PPP monograph (Vol. 3 / Annex B) is used.</p> <p>The methods have been evaluated in the 91/414/EC Draft Assessment Report (Monograph) on Spinosad of February 2001 in section Spinosadvol3B5 – Annex B – PCP and Methods Section.</p> <p>The full 91/414/EEC DAR and its addenda are enclosed in the “other documentation” section as described Document I.1 – Application form, point 6.9.</p> <p>Below is an <u>unchanged copy of the relevant parts of the Spinosad 91/414/EC Draft Assessment Report (DAR)</u> written by the CA (CTB) and released in February 2001. No further information was given in the addenda of June 2002 and May 2005. DAR numbering has been kept the way it is in the DAR for ease of tracking.</p>		

B.5.1.1 Technical active substance

The validated procedure is a reverse-phase liquid chromatographic method (HPLC) using a C-18 HPLC column. Spinosyn A and Spinosyn D are separated from the other components in the technical material and detected using ultraviolet detection at 250 nm.

The technical sample was dissolved in and diluted with methanol. Chromatography was carried out on a C 18 column with a mobile phase consisting of acetonitrile/methanol and a 2 % ammonium acetate solution (44:44:12 v/v/v). The components were detected by UV at 250 nm.

Validation:

Linearity:

Factor A: linear from 9.72 to 145.8 µg/ml and Factor D: linear from 0.8 to 30 µg/ml

Accuracy: factor A recovery 99.7 % and Factor D 94.6 % in synthetic samples;

Repeatability: RSD = 0.54 % for factor A and RSD= 0.78 % for factor D.

Specificity: based on HPLC-UV

Interference: none detected from chromatogram.

Reference: Frawley, 1994b

An earlier method, used for the characterisation of some of the earlier materials, also uses an HPLC procedure with UV detection. Good linearity over the range 0.004 to 0.560 µg/mL was shown. And a repeatability of <0.63 % for the sum

Reference: Handy, 1991

Section A4.2**Analytical Methods for Detection and Identification**

Annex Point IIA, IIA-IV.4.2

4.2 **Analytical methods on: (a) soil;** (b) air; (c) water; (d) animal and human body fluids and tissues

As described in the "Guidance Document on How to utilize PPP dossiers/monograph" of 21 November 2003 the evaluation of the CA from the PPP monograph (Vol. 3 / Annex B) is used.

The methods have been evaluated in the 91/414/EC Draft Assessment Report (DAR) on Spinosad of February 2001 in section Spinosadvol3B5 – Annex B – PCP and Methods Section.

The full 91/414/EEC DAR and its addenda are enclosed in the "other documentation" section as described Document I.1 – Application form, point 6.9.

Below is an unchanged copy of the relevant parts of the Spinosad Draft Assessment Report written by the CA (CTB) and released in February 2001 and the 2nd Addendum to the Draft Assessment Report released in May 2005. No further information was given in the 1st addendum of June 2002. Numbering as in the Draft Assessment Report and the Addendum remains unchanged for ease of back tracking.

Taken from the 91/414/EEC Draft Assessment Report of February 2001

B.5.3.1 Residues in soil (Annex IIA 4.2.2)

a) OR19, OR30

Description

Residues of spinosyn A, D, B and N-demethylated spinosyn D are extracted from soil by ultrasonication and shaking with two volumes of a methanol/5% NaCl/1N NaOH (65:27:8 v/v) solution. The two extraction solutions are combined and made up to a known volume with the extraction solution. An aliquot of the extraction solution is purified by partitioning with hexane following the addition 0.16 N hydrochloric acid containing 5% sodium chloride/ (w/v). The hexane layer is discarded. The aqueous layer is made basic by the addition of 1M sodium hydroxide and the spinosyns partitioned into hexane. The hexane is dried with sodium sulphate and evaporated to dryness. The residue is reconstituted in hexane prior to further clean up using a silica SPE cartridge. The silica SPE is washed with hexane, dichloromethane, and acetonitrile before eluting the spinosyns with a methanol/dichloromethane solution (25:75 v/v). The eluate is evaporated to dryness and reconstituted in the HPLC mobile phase where all four spinosyns are determined simultaneously by reversed phase HPLC with UV detection at 250 nm. Quantitative confirmation of the results can be achieved by replacing the C18 analytical column with a mixed phase cation exchange/C18 column and re-injecting the samples. The residues are considered to be confirmed, if the retention times of the analytes matched those of the standards on both columns, and if the confirmatory column gave results that were within $\pm 20\%$ of the results obtained on the primary column.

The method described here, was independently validated at ABC Laboratories, Missouri. During the validation exercise, two minor modifications to the original procedure were introduced. The first modification involved a change in the composition of the HPLC mobile phase to improve separation from co-extracted interferences. The second modification involved the use of hand packed silica gel glass columns to reduce interferences resulting from the silica SPE columns recommended in the method.

Results

The following recovery values (mean \pm σ) resulted from fortified samples (n=35) over six concentrations ranging from 0.01 to 1.0 $\mu\text{g/g}$ for spinosyn A, D, B and N-demethylated D: 82 \pm 5%, 83 \pm 6%, 78 \pm 6% and 76 \pm 6%. The relative standard deviation (RSD) ranged from 2% to 11% for all four analytes at all fortification levels. The average correlation coefficient (r^2) for the least squares regression equations describing the detector response as a function of the standard calibration curve concentration was 0.9998-0.9999 for all four analytes. The limit of detection was 0.003 $\mu\text{g/g}$, and the limit of quantification was 0.01 $\mu\text{g/g}$.

Independent validation of the method showed recoveries of 82 \pm 8%, 78 \pm 5%, 86 \pm 5%, and 77 \pm 8% from samples (n=4) fortified at 0.01 or 0.05 $\mu\text{g/g}$ spinosyn A, B, D, and N-demethylated D respectively.

B.5.5 EVALUATION AND ASSESSMENT

Analytical methods (residue) soil, water, air

Where information has been submitted, it fulfils the following criteria:

adequate limit of determination (soil: 0.05 mg/kg, water: 0.1 $\mu\text{g/L}$);

mean recovery 70-110%;

relative standard deviation of recovery rates <20%;

interfering blanks lower than 30% of the limit of determination;

readily available equipment and reagents used.

In Table B.5.5-1 the method descriptions and validation data are summarised.

Table B.5.5-1 Summary of method description and validation

Description

Method validation.

Soil and sediment were applied with a stock of each of the test substances in methanol/acetonitrile (1:1). Fortification levels 0.005, 0.05, 0.25, and 1.00 µg/L. Representative samples of soil and sediment matrix were fortified at 0.001 µg/g to demonstrate the method LOD.

ANALYSIS METHOD

GRM 03.19. Residues of spinosad and its metabolites are extracted from soil samples by shaking with a solution of methanol/5% NaCl/ 1N NaOH. An aliquot of the extraction solvent is diluted with 10% NaCl, and spinosad and its metabolites are partitioned into methyl *tert*-butyl ether. After evaporation to dryness, the residues are reconstituted in a solution of acetonitrile/methanol/water containing 0.1% ammonium acetate. The final solution is analysed by LC/MS/MS.

Results

The method was validated over the concentration range of 0.25-1.0 µg/g with a LOQ of 0.005 µg/g.

Remarks by RMS

Soil types tested were: loam, clay loam, silt, sandy loam, silt loam, silty clay loam, sandy clay loam and loamy sand. Sediment types tested were: sandy clay loam, loamy sand, sandy loam, and loam.

According to the Guidance document on residue analytical methods (SANCO/825/00 rev. 7, 17-03-2004), the sample set should consist of 5 samples per tested concentration per substrate. This condition was only met for the sandy loam soil at concentrations of 0.25 and 1.00 µg/g. Therefore only the results of this part of the study are used for the risk assessment.

	<p>6 MATERIALS AND METHODS</p>	
<p>6.1 Preliminary treatment</p>		
<p>6.1.1 Enrichment</p>	<p>Residues of spinosad and its metabolites are extracted from a 5-g soil sample by shaking for 30 minutes with a methanol/5% sodium chloride/1N sodium hydroxide (65:27:8) solution. The sample is centrifuged and the extraction solution is decanted into a graduated mixing cylinder. The extraction process is repeated with a second aliquot of the extraction solution. The extracts are combined and made up to a known volume with the extraction solution.</p>	
<p>6.1.2 Cleanup</p>	<p>An aliquot of the extraction solvent is diluted with 10% sodium chloride, and spinosad and its metabolites are partitioned into methyl tert-butyl ether (MTBE). The MTBE is evaporated to dryness and the residues are reconstituted in an acetonitrile/methanol/water (4:4:2) solution containing 0.1% ammonium acetate.</p>	
<p>6.2 Detection</p>		
<p>6.2.1 Separation method</p>	<p>The final solution is analyzed by gradient high performance liquid chromatography using a YMC ODS-AM column (5-μm, 150 x 4.6 mm i.d.) with a acetonitrile:methanol:water:acetic acid mobile phase.</p>	
<p>6.2.2 Detector</p>	<p>Detection of spinosad and its metabolites is performed with positive-ion atmospheric pressure chemical ionization (APCI) tandem mass</p>	

<p>Section A4 (4.2)</p> <p>Annex Point IIA, IIA-IV.4.2</p>	<p>Analytical Methods for Detection and Identification</p> <p>Specify where appropriate, e.g. isomer of a.s., metabolite of a.s., impurity of a.s., matrix</p> <p>4.1 for the determination of pure active substance</p> <p>4.2 Analytical methods on: (a) soil; (b) air; (c) water; (d) animal and human body fluids and tissues</p>

	<p>7 APPLICANT'S SUMMARY AND CONCLUSION</p>																															
<p>7.1 Materials and methods</p>	<p>Dow AgroSciences method GRM 03.19 is applicable for the quantitative determination of residues of spinosad and its metabolites in soil and sediment. The method was validated over the concentration range of 0.005-1.0 µg/g. The validated limit of quantification for the method is 0.005 µg/g.</p> <p>Residues of spinosad and its metabolites are extracted from soil samples by shaking with a methanol/5% sodium chloride/1N sodium hydroxide solution (65:27:8). An aliquot of the extraction solvent is diluted with 10% sodium chloride and spinosad and its metabolites are partitioned into methyl <i>tert</i>-butyl ether (MTBE). The MTBE is evaporated to dryness and the residues are reconstituted in an acetonitrile/methanol/water (4:4:2) solution containing 0.1% ammonium acetate. The final solution is analyzed by liquid chromatography with positive ion atmospheric pressure chemical ionization (APCI) tandem mass spectrometry (LC/MS/MS).</p> <p>A calibration curve resulting from the injection of eight standards demonstrated linearity with a correlation coefficient of at least 0.9997. LC/MS/MS affords a highly specific method for quantification and confirmation of spinosad and its metabolites by retention time matching with standards in conjunction with monitoring analyte specific precursor-ion/product-ion transitions.</p>																															
<p>7.2 Conclusion</p>	<p>The data summarized below demonstrates the suitability of method GRM 03.19 for the analysis of spinosad and its metabolite residues in soil and sediment.</p> <table border="1" data-bbox="635 1503 1326 1731"> <thead> <tr> <th>Analyte</th> <th>Fortification Level (µg/g)</th> <th>Average Recovery (%)</th> <th>Recovery Range (%)</th> <th>SD (%)</th> <th>RSD (%)</th> </tr> </thead> <tbody> <tr> <td>Spinosyn A</td> <td>0.005– 1.0</td> <td>92</td> <td>76 – 111</td> <td>6.2</td> <td>6.8</td> </tr> <tr> <td>Spinosyn D</td> <td>0.005– 1.0</td> <td>91</td> <td>74 – 107</td> <td>5.9</td> <td>6.5</td> </tr> <tr> <td>Spinosyn B</td> <td>0.005– 1.0</td> <td>88</td> <td>76 – 101</td> <td>5.5</td> <td>6.2</td> </tr> <tr> <td><i>N</i>-demethyl spinosyn D</td> <td>0.005– 1.0</td> <td>88</td> <td>77 – 101</td> <td>5.8</td> <td>6.6</td> </tr> </tbody> </table>	Analyte	Fortification Level (µg/g)	Average Recovery (%)	Recovery Range (%)	SD (%)	RSD (%)	Spinosyn A	0.005– 1.0	92	76 – 111	6.2	6.8	Spinosyn D	0.005– 1.0	91	74 – 107	5.9	6.5	Spinosyn B	0.005– 1.0	88	76 – 101	5.5	6.2	<i>N</i> -demethyl spinosyn D	0.005– 1.0	88	77 – 101	5.8	6.6

B.5.3.3 Residues in air (Annex IIA 4.2.4)

a) OR75

Description

Air is sampled with an OVS tube containing glass fibre filter to collect aerosol and XAD-2 to collect vapour that passes through the filter. For method validation OVS tubes were fortified with 11.6, 141 and 1320 µg Spinosad/tube. The filters were air dried for about 10 minutes. Then 80 % relative humidity-air was pulled through each tube at 1 L/min for 8 hours. Spinosad was desorbed with acetonitril.

Residues of spinosyn A and spinosyn B were analysed by reversed phase HPLC on a C-18 column, with a mobile phase consisting of 0.01 M ammonium acetate in 90/10 acetonitril/water. UV detection was carried out at 254 nm.

Validation:

At a air-humidity of 80 %

Linearity was demonstrated for 2 to 2000 µg spinosad.

Recovery: 65.8 % for tubes fortified with 11.6 µ, 84.1 % for tubes fortified with 141 µ and 93.1 % for samples fortified at 1320 µg.

Based on a through put of 480 liter air, the calculated LOQ based on the 141 µg addition is 0.294 mg/m³.

B.5.5 EVALUATION AND ASSESSMENT

Analytical methods (residue) soil, water, air

Where information has been submitted, it fulfils the following criteria:

adequate limit of determination (soil: 0.05 mg/kg, water: 0.1 µg/L);

mean recovery 70-110%;

relative standard deviation of recovery rates <20%;

interfering blanks lower than 30% of the limit of determination;

readily available equipment and reagents used.

In Table B.5.5-1 the method descriptions and validation data are summarised.

Title,

Description

Analysis method GRM 02.18

A measured volume of air is drawn through a commercial Tenax two-segment configured adsorption tube. After air sampling, the front and back-up beds are extracted with a solution of methanol, acetonitrile and aqueous ammonium acetate. An aliquot of the extract is analysed by HPLC with +APCI mass spectroscopy detection (LC-MS/MS).

Validation

Extractability

Tubes of Tenax adsorbent are fortified in triplicate to give loadings of 0.259, 2.59 and 25.9 µg spinosad in methanol/acetonitrile 50/50 (v/v) along with unfortified control tubes containing 100 µL of methanol/acetonitrile (50/50) (v/v) only. The loadings are equivalent to air concentrations of 0.73, 7.3 and 73 µg/m³.

The test solutions were applied with a 100 µL glass syringe to the front portion of the tube packing. After allowing the solvent to evaporate, the tubes were analysed according to the method described below.

Breakthrough

Air with the following characteristics was used: ambient temperature and relative humidity, and at 35 °C and 80% relative humidity. For each set of conditions, 1 control tube and 5 tubes fortified at 0.264 µg, 2.64 µg and 26.4 µg were tested. After the 6-hour period, the tubes were separated into front and back segments and analysed.

Storage stability

The storage stability of spinosad in extracts from Tenax adsorbent tubes was measured after 4 and 7 days of storage at room temperature and at 4 °C. Three fortified tubes were stored at <18 °C, 4 °C and ambient room temperature for 4 and 8 days prior to analysis.

Results

The LOQ was 0.73 µg/m³ for spinosyn A and spinosyn D, respectively. No significant breakthrough was observed in any of the rear segments. Linearity was reported to be 1.000 for both spinosyn A and D.

Remarks by RMS

Significant loss of the analyte was seen after 8 days when tubes were stored at ambient room temperature. Purity of test substances not reported.

9.1 Guideline study	Yes	
9.2 GLP	Yes	
9.3 Deviations	No	
	10 MATERIALS AND METHODS	
10.1 Preliminary treatment		
10.1.1 Enrichment	Simulated sampling was conducted at ambient temperature and humidity and again at elevated temperature and humidity (35 °C and ≥ 80% r.h.). A measured volume of air is drawn through a commercial Tenax two-segment configured adsorption tube for 6 hours at a flow rate of 1 L/minute. After air sampling, spinosad (spinosyns A and D) is extracted from the tube adsorbent with a methanol, acetonitrile, and aqueous ammonium acetate solution.	
10.1.2 Cleanup	The sample is centrifuged to separate the adsorbent from the extract. An aliquot of the sample extract is transferred to an autosampler vial for analysis.	
10.2 Detection		
10.2.1 Separation method	The final sample extract is analyzed by gradient high performance liquid chromatography using a Phenomenex Prodigy column (5-µm, 100 x 4.6 mm i.d.) with a acetonitrile:methanol:water:ammonium acetate mobile phase.	
10.2.2 Detector	Detection of spinosad is performed with positive-ion atmospheric pressure chemical ionization (APCI) tandem mass spectrometry (MS/MS) monitoring analyte specific precursor-ion/product-ion transitions (fragments) of the spinosad as follows:	

Section A4 (4.2) Annex Point IIA, IIA-IV.4.2	Analytical Methods for Detection and Identification Specify where appropriate, e.g. isomer of a.s., metabolite of a.s., impurity of a.s., matrix 4.1 for the determination of pure active substance 4.2 Analytical methods on: (a) soil; (b) air; (c) water; (d) animal and human body fluids and tissues																																																																																																
	Spinosyn A <i>m/z</i> Q1/Q3 732.6/142.2 Spinosyn D <i>m/z</i> Q1/Q3 746.6/142.2																																																																																																
10.2.3 Standard(s)	Quantitation of residues of spinosad (spinosyns A and D) is performed using an external calibration standard technique.																																																																																																
10.2.4 Interfering substance(s)	During the validation study, 5 replicates at each of 3 different concentration levels were analysed. No interferences from the extraction of the unfortified control tubes were observed.																																																																																																
10.3 Linearity																																																																																																	
10.3.1 Calibration range	0.005 – 0.20 µg/mL (5.0 – 200 ng/mL). An adsorbent tube fortified with spinosad at the validated limit of quantification of the method at 0.264 µg per tube is equivalent to 0.73 µg/m ³ based on a 360-L air volume. (Solutions containing more than 0.2 µg/mL of spinosad were diluted to keep them within the range of the calibration curve.)																																																																																																
10.3.2 Number of measurements	Six (6) standards of each, spinosyns A and D were injected throughout the analytical run.																																																																																																
10.3.3 Linearity	The typical calibration curves shown yielded correlation coefficients (r) of 1.0000 for both spinosyns A and D.																																																																																																
10.4 Specificity: interfering substances	HPLC/MS/MS affords a highly specific method for both quantitation and confirmation of residue identity by retention time matching in conjunction with monitoring the specific MS/MS ion transitions of spinosad (spinosyns A and D).

	<p>11 APPLICANT'S SUMMARY AND CONCLUSION</p>	
<p>11.1 Materials and methods</p>	<p>Dow AgroSciences method GRM 02.18 is applicable for the quantitative determination of residues of spinosad (spinosyns A and D) in air. The method was validated over the concentration range of 0.73 µg/m³ to 73 µg/m³. The validated limit of quantitation for the method is 0.264 µg per adsorbent tube or 0.73 µg/m³ based on a 360-L air volume.</p> <p>A measured volume of air is drawn through a commercial Tenax two-segment configured adsorption tube for 6 hours at a flow rate of 1 L/minute. After air sampling, the sorbent is removed from Tenax adsorbent sample tubes. Residues of spinosad are extracted from samples by shaking vigorously for 30 minutes with 10.0 mL of a 95:5 solution (A:B) where A = methanol/acetonitrile 1:1 (v/v) + 0.1% (w/v) and B = deionized water + 0.1% ammonium acetate. An aliquot of the sample extract is transferred to an autosampler vial for analysis without additional cleanup. Samples that exceed the range of the calibration curve are diluted to keep the concentrations within the range of the curve. The final solution and along with the calibration standards is analyzed by liquid chromatography with positive ion atmospheric pressure chemical ionization (APCI) tandem mass spectrometry (LC/MS/MS).</p> <p>A calibration curve resulting from the injection of six standards demonstrated linearity with a typical correlation coefficient (r) of 1.0000. LC/MS/MS affords a highly specific method for quantitation and confirmation of spinosad by retention time matching with standards in conjunction with monitoring analyte specific precursor-ion/product-ion transitions.</p> <p><u>Storage Stability</u></p> <p>The storage stability of spinosad in final extracts derived from fortified Tenax tubes was measured after 4 and 7 days of storage—both at ambient temperature and at 4 °C. There was no significant loss of analyte observed even after 7 days when stored at either at ambient</p>	

<p>Section A4 (4.2)</p> <p>Annex Point IIA, IIA-IV.4.2</p>	<p>Analytical Methods for Detection and Identification</p> <p>Specify where appropriate, e.g. isomer of a.s., metabolite of a.s., impurity of a.s., matrix</p> <p>4.1 for the determination of pure active substance</p> <p>4.2 Analytical methods on: (a) soil; (b) air; (c) water; (d) animal and human body fluids and tissues</p>																																									
	<p>temperature or at 4 °C.</p> <p>The storage stability of spinosad in fortified Tenax adsorbent tubes was determined for tubes stored at <-18 °C, at 4 °C, and at ambient temperature for 4 and 8 days. There was a small loss of the analyte observed after the 4-day storage period at ambient temperature and a more significant loss of the analyte observed in the tubes stored at ambient temperature after the 8-day period. The tubes stored at 4 °C or at <-18 °C did not show any significant loss of analyte after either the 4 or the 8-day storage periods.</p>																																									
<p>11.2 conclusion</p>	<p>The data summarized below demonstrates the suitability of method GRM 02.18 for the analysis of spinosad residues in air.</p> <table border="1" data-bbox="571 920 1321 1144"> <thead> <tr> <th>Analyte</th> <th>Matrix^a</th> <th>Fortification Level (µg)</th> <th>Fortification Level (µg)^b</th> <th>Average Recovery (%)</th> <th>Recovery Range (%)</th> <th>SD (%)</th> <th>RSD (%)</th> </tr> </thead> <tbody> <tr> <td>Spinosyn A</td> <td>Air (ambient)</td> <td>0.264 – 26.4</td> <td>0.228 – 22.8</td> <td>85</td> <td>77 – 94</td> <td>6.96</td> <td>8.22</td> </tr> <tr> <td>Spinosyn A</td> <td>Air (elevated)</td> <td>0.264 – 26.4</td> <td>0.228 – 22.8</td> <td>89</td> <td>76 – 101</td> <td>6.81</td> <td>7.61</td> </tr> <tr> <td>Spinosyn D</td> <td>Air (ambient)</td> <td>0.264 – 26.4</td> <td>0.0360 – 3.60</td> <td>86</td> <td>75 – 96</td> <td>7.04</td> <td>8.22</td> </tr> <tr> <td>Spinosyn D</td> <td>Air (elevated)</td> <td>0.264 – 26.4</td> <td>0.0360 – 3.60</td> <td>89</td> <td>75 – 95</td> <td>5.50</td> <td>6.19</td> </tr> </tbody> </table> <p>^aAmbient air conditions are approximately 22 °C and 43% relative humidity. Acceptability	See Remarks	
Remarks	Based on the same studies, the following conclusion was drawn in the second Addendum to the DAR, issued in May/July 2005 and revised in March 2006: Analysis method GRM 02.18 is valid for the determination of spinosyn A and D in air. The method has been validated over the concentration range of 0.73 µg/m ³ to 73 µg/m ³ . On the basis of the ADI of 0.024 mg/kg body weight, the required LOQ is 7.2 µg/m ³ , so the validated LOQ is sufficient. Storage at room temperature results in significant loss of the analyte. A confirmatory technique is not considered necessary in view of the specific identification used.

B.5.3.2 Residues in water (Annex IIA 4.2.3) - Taken from the 91/414/EEC Draft Assessment Report of February 2001

a) OR74

Description

Residues of spinosyns A, D, B and N-demethylated spinosyn D are extracted from water with methyl-tert-butyl ether after addition of 1 M NaOH. An aliquot of the ether layer is evaporated to dryness and reconstituted in the HPLC mobile phase. Spinosyn A, spinosyn D, spinosyn B, spinosyn K, N-demethylated spinosyn D residues are determined simultaneously by reversed phase HPLC with positive ion atmospheric pressure ionisation mass spectroscopy detection (+APCI/MS).

Results

Average recovery values of 95% to 109% resulted from fortified samples (n=32) over four concentrations ranging from 0.1 to 5.0 µg/L for spinosyn A, B, D, K or N-demethylated spinosyn D in drinking water, surface water or ground water. The relative standard deviation (RSD) ranged from 4.1 to 11% for all five analytes at all fortification levels. The average correlation coefficient (r^2) for the least squares regression describing the detector response as a function of concentration (n=8) was 0.95 for all five analytes. The limit of detection was 0.02 µg/L, and the limit of quantification was 0.1 µg/L.

b) OR 17

Description

The method is based upon use of the Strategic Diagnostics Spinosad RaPID™ Assay test kit and the RPA-1 RaPID Analyser. The antibody used in the spinosad immunoassay test kit is sensitive to several spinosyns, including the active ingredients (spinosyns A and D). The kit uses spinosyn A, the major component of spinosad, for generation of the calibration curve and subsequent quantitation of the residue. The method is not designed to differentiate individual spinosyns, but instead measures the total residue of spinosyns and its degradation products.

An aliquot of the water sample is diluted with Spinosad Sample Diluent and then assayed for spinosyn residues using the Strategic Diagnostics Spinosad RaPID Assay test kit, which applies the principles of enzyme-linked immunosorbent assay. An aliquot of the sample is incubated with enzyme-conjugated spinosad and magnetic particles coated with antibodies specific to spinosad. The spinosad in the sample and the enzyme-conjugated spinosad compete for antibody sites on the magnetic particles. At the end of the incubation period, a magnetic field is applied to the particles. The spinosad and enzyme-conjugated spinosad, which are bound to the antibodies on the particles, are held in the sample tube by the magnetic field while the unbound reagents are decanted. The presence of spinosyns is detected by incubating the antibody-bound enzyme conjugate with an enzyme substrate (hydrogen peroxide) and a chromogen (3,3',5,5'-tetramethylbenzidine), generating a coloured product. Since the enzyme-labelled spinosyns are in competition with free (sample) spinosyns for the antibody sites, the level of colour development is inversely proportional to the concentration of the spinosyns in the sample (i.e., lower residue concentrations result in greater colour development). The absorbance at 450 nm is measured in each sample tube using the RPA-1 RaPID Analyser. A calibration curve is generated and the spinosyn concentration in unknown samples is calculated from the regression equation using the pre-programmed software capabilities of the RPA-1 RaPID Analyser.

Results

Average recovery values ranging from 91-112% resulted from fortified samples (n=31) over six concentrations ranging from 0.1 to 20.0 µg/L for spinosad. The relative standard deviation (RSD) ranged from 3.8% to 14%. The limit of detection was 0.042 µg/L, and the limit of quantification was 0.14 µg/L.

B.5.5 EVALUATION AND ASSESSMENT

Analytical methods (residue) soil, water, air

Where information has been submitted, it fulfils the following criteria:

adequate limit of determination (soil: 0.05 mg/kg, water: 0.1 µg/L);

mean recovery 70-110%;

relative standard deviation of recovery rates <20%;

interfering blanks lower than 30% of the limit of determination;

readily available equipment and reagents used.

In Table B.5.5-1 the method descriptions and validation data are summarised.

Table B.5.5-1 Summary of method description and validation

Description

Method validation.

Three types of water were applied with a stock of mixed spinosyn A, D, B and N-demethylated spinosyn D and a stock of mixed 13,14 beta-dihydro C17-pseudoaglycone of spinosyn A and D. Fortification levels 0.003- 1.0 µg/L with 6 replicates each, a reagent blank and a control.

Analysis method.

GRM 03.17. Residues of spinosad and its metabolites in water samples are extracted using methyl *tert*-butyl ether and concentrated under nitrogen. The residues are reconstituted in an acetonitrile/water (40:60) solution containing 5 mM ammonium acetate. The final solution is analysed by LC/MS/MS. The presence of spinosad and its metabolites is confirmed by comparing the liquid chromatography retention times of the analyte in the calibration standards with those found in the samples as well as by the MS/MS transitions monitored.

Results

LOQ 0.01 µg/L defined as lowest fortification level with acceptable recovery. A calibration curve resulting from the injection of eight standards demonstrated linearity with a correlation coefficient of at least 0.9988.

Remarks by RMS

No information available on characteristics of water used in the study. Purity of test substances not reported. Method meets validity criteria.

13.1 Guideline study	Yes	
13.2 GLP	Yes	
13.3 Deviations	No	
	14 MATERIALS AND METHODS	
14.1 Preliminary treatment		
14.1.1 Enrichment	Residues of spinosad and its metabolites are extracted from a 10-mL water sample under alkaline conditions by partitioning with methyl <i>tert</i> -butyl ether (MTBE) and concentrated under nitrogen.	
14.1.2 Cleanup	The residuum is reconstituted with an acetonitrile/water (40:60) solution containing 5 mM ammonium acetate.	
14.2 Detection		
14.2.1 Separation method	The samples are chromatographed by gradient high performance liquid chromatography using a Luna Phenyl-Hexyl column (5- μ m, 50 x 2.00 mm i.d.) with a acetonitrile:water:ammonium acetate mobile phase.	
14.2.2 Detector	Detection of spinosad and its metabolite residues is performed by positive-ion electrospray ionization (ESI) tandem mass spectrometry (MS/MS) monitoring the analyte specific precursor-ion/product ion transitions (fragments) of the spinosyns as follows: Spinosyn A <i>m/z</i> Q1/Q3 732.5/142.1 Spinosyn D <i>m/z</i> Q1/Q3 746.5/142.1 Spinosyn B <i>m/z</i> Q1/Q3 718.5/128.1 <i>N</i> -demethyl spinosyn D <i>m/z</i> Q1/Q3 732.5/128.1	

Section A4 (4.2) Annex Point IIA, IIA-IV.4.2	Analytical Methods for Detection and Identification Specify where appropriate, e.g. isomer of a.s., metabolite of a.s., impurity of a.s., matrix 4.1 for the determination of pure active substance 4.2 Analytical methods on: (a) soil; (b) air; (c) <u>water</u> ; (d) animal and human body fluids and tissues	
	β-13,14-dihydro C17-pseudoaglycone of Spinosyn A <i>m/z</i> Q1/Q3 610.4/189.1 β-13,14-dihydro C17-pseudoaglycone of Spinosyn D <i>m/z</i> Q1/Q3 624.5/189.1	
14.2.3 Standard(s)	Quantitation of residues of spinosad and its metabolite is performed using an external calibration standard technique.	
14.2.4 Interfering substance(s)	During the validation study, 7 different water samples were analysed. No interferences from co-extracted species were observed.	
14.3 Linearity		
14.3.1 Calibration range	0.00001 – 0.0050 µg/mL (0.01 – 5.0 ng/mL). Equivalent to 0.0010 – 0.50 ng/mL (µg/L) spinosyns A and D and their metabolites, spinosyn B, N-demethyl spinosyn D, 13,14β-dihydro C17-pseudoaglycone of Spinosyn A (referred to as spinosyn A pseudoaglycone in this method), and 13,14β-dihydro C17-pseudoaglycone of Spinosyn D (referred to as spinosyn D pseudoaglycone in this method), in drinking water, ground water, and surface water.	
14.3.2 Number of measurements	8 standards injected throughout the analytical run.	
14.3.3 Linearity	The calibration curves from 3 analytical runs yielded correlation coefficients (r) of at least 0.9988.	

<p>Section A4 (4.2)</p> <p>Annex Point IIA, IIA-IV.4.2</p>	<p>Analytical Methods for Detection and Identification</p> <p>Specify where appropriate, e.g. isomer of a.s., metabolite of a.s., impurity of a.s., matrix</p> <p>4.1 for the determination of pure active substance</p> <p>4.2 Analytical methods on: (a) soil; (b) air; (c) <u>water</u>; (d) animal and human body fluids and tissues</p>																																																																																																												
<p>14.4 Specificity: interfering substances</p>	<p>HPLC/MS/MS affords a highly specific method for both quantitation and confirmation of residue identity by retention time matching in conjunction with monitoring the specific MS/MS ion transitions of spinosad and its metabolites.</p>

<p>14.6 Limit of determination</p>	<p>Following established guidelines (1), the limits of quantitation (LOQ) and detection (LOD) for the determination of spinosad and its metabolites in water samples were calculated using the standard deviation of the 0.01-$\mu\text{g/L}$ (ng/mL) recovery results. The LOQ was calculated as ten times the standard deviation (10s), and the LOD was calculated as three times the standard deviation (3s) of the results of the analysis of a minimum of 18 samples. The results are summarized below.</p> <table border="1" data-bbox="651 786 1270 1128"> <thead> <tr> <th>Analyte</th> <th>Average Recovery, ($\mu\text{g/L}$)</th> <th>Standard Deviation, (s)</th> <th>Limit of Detection, (3s)</th> <th>Limit of Quantitation, (10s)</th> </tr> </thead> <tbody> <tr> <td>Spinosyn A</td> <td>0.00818</td> <td>0.00068</td> <td>0.0020</td> <td>0.0068</td> </tr> <tr> <td>Spinosyn D</td> <td>0.00781</td> <td>0.00072</td> <td>0.0022</td> <td>0.0072</td> </tr> <tr> <td>Spinosyn B</td> <td>0.00923</td> <td>0.00053</td> <td>0.0016</td> <td>0.0053</td> </tr> <tr> <td><i>N</i>-demethyl Spinosyn D</td> <td>0.00953</td> <td>0.00067</td> <td>0.0020</td> <td>0.0067</td> </tr> <tr> <td>13,14β-dihydro C17-pseudoaglycone of Spinosyn A</td> <td>0.00962</td> <td>0.00058</td> <td>0.0017</td> <td>0.0058</td> </tr> <tr> <td>13,14β-dihydro C17-pseudoaglycone of Spinosyn D</td> <td>0.00919</td> <td>0.00060</td> <td>0.0018</td> <td>0.0060</td> </tr> </tbody> </table> <p>The calculated LOQ supports the validated method LOQ of 0.01 ng/mL. <p>14.7.1 Repeatability</p>	<p>No specific repeatability data was generated. However, the data presented in section 3.5, 3.5.1, and 3.6 is a composite of three analytical validation batches generated over a period of five days.</p>																																				
<p>14.7.2 Independent laboratory validation</p>	<p>No independent validation was conducted on method GRM 03.17.</p>																																				

<p>Section A4 (4.2)</p> <p>Annex Point IIA, IIA-IV.4.2</p>	<p>Analytical Methods for Detection and Identification</p> <p>Specify where appropriate, e.g. isomer of a.s., metabolite of a.s., impurity of a.s., matrix</p> <p>4.1 for the determination of pure active substance</p> <p>4.2 Analytical methods on: (a) soil; (b) air; (c) <u>water</u>; (d) animal and human body fluids and tissues</p>																																											
	<p>15 APPLICANT'S SUMMARY AND CONCLUSION</p>																																											
<p>15.1 Materials and methods</p>	<p>Dow AgroSciences method GRM 03.11 is applicable for the quantitative determination of residues of spinosad and its metabolites in water. The method was validated over the concentration range of 0.01-1.0 µg/L (ng/mL). The validated limit of quantitation for the method is 0.01 µg/L (ng/mL).</p> <p>Residues of spinosad and its metabolites are extracted from a 10-mL water sample under alkaline conditions by partitioning with methyl <i>tert</i>-butyl ether (MTBE) and concentrated under nitrogen. The residuum is reconstituted with an acetonitrile/water (40:60) solution containing 5 mM ammonium acetate. Detection of spinosad and its metabolite residues is performed by positive-ion electrospray ionization (ESI) tandem mass spectrometry (LC/MS/MS).</p> <p>A calibration curve resulting from the injection of eight standards demonstrated linearity with a correlation coefficient of at least 0.9988. LC/MS/MS affords a highly specific method for quantitation and confirmation of spinosad and its metabolites by retention time matching with standards in conjunction with monitoring analyte specific precursor-ion/product-ion transitions.</p>																																											
<p>15.2 Conclusion</p>	<p>The data summarized below demonstrates the suitability of method GRM 03.17 for the analysis of spinosad and its metabolite residues in water samples.</p> <table border="1" data-bbox="638 1422 1324 1803"> <thead> <tr> <th>Analyte</th> <th>Fortification Level, (µg/L)</th> <th>Average Recovery (%)</th> <th>Recovery Range (%)</th> <th>SD (%)</th> <th>RSD (%)</th> </tr> </thead> <tbody> <tr> <td>Spinosyn A</td> <td>0.01 – 1.0</td> <td>82</td> <td>71 - 96</td> <td>6</td> <td>8</td> </tr> <tr> <td>Spinosyn D</td> <td>0.01 – 1.0</td> <td>79</td> <td>67 - 95</td> <td>7</td> <td>8</td> </tr> <tr> <td>Spinosyn B</td> <td>0.01 – 1.0</td> <td>89</td> <td>81 - 101</td> <td>5</td> <td>5</td> </tr> <tr> <td><i>N</i>-demethyl spinosyn D</td> <td>0.01 – 1.0</td> <td>92</td> <td>84 - 112</td> <td>6</td> <td>6</td> </tr> <tr> <td>13,14β-dihydro C17-pseudoaglycone of Spinosyn A</td> <td>0.01 – 1.0</td> <td>95</td> <td>85 - 107</td> <td>4</td> <td>4</td> </tr> <tr> <td>13,14β-dihydro C17-pseudoaglycone of Spinosyn D</td> <td>0.01 – 1.0</td> <td>91</td> <td>83 - 102</td> <td>4</td> <td>5</td> </tr> </tbody> </table>	Analyte	Fortification Level, (µg/L)	Average Recovery (%)	Recovery Range (%)	SD (%)	RSD (%)	Spinosyn A	0.01 – 1.0	82	71 - 96	6	8	Spinosyn D	0.01 – 1.0	79	67 - 95	7	8	Spinosyn B	0.01 – 1.0	89	81 - 101	5	5	<i>N</i> -demethyl spinosyn D	0.01 – 1.0	92	84 - 112	6	6	13,14β-dihydro C17-pseudoaglycone of Spinosyn A	0.01 – 1.0	95	85 - 107	4	4	13,14β-dihydro C17-pseudoaglycone of Spinosyn D	0.01 – 1.0	91	83 - 102	4	5

Acceptability	See Remarks	
Remarks	Based on the same studies, the following conclusion was drawn in the second Addendum to the DAR, issued in May/July 2005 and revised in March 2006: Analysis method GRM 03.17 is valid for the determination of spinosyn A and D, and their metabolites, spinosyn B, N-demethyl spinosyn D, 13,14beta-dihydro-C17-pseudoaglycone of Spinosyn A and D in drinking water, ground water, and surface water. The method was validated over the concentration range of 0.01-1.0 µg/L with a validated LOQ of 0.01 µg/L. A confirmatory technique is not considered necessary in view of the specific identification method used.

Section A4.2 Annex Point IIA, IIA-IV.4.2	Analytical Methods for Detection and Identification Specify where appropriate, e.g. isomer of a.s., metabolite of a.s., impurity of a.s., matrix 4.2 <u>Analytical methods on: (a) soil; (b) air; (c) water; (d) animal and human body fluids and tissues</u>	
	Spinosad is not classified as toxic or highly toxic, therefore according to the Technical Notes on Guidance, Chapter 2, Part A, no methods on animal and human body fluids and tissues need to be submitted. However, methods of spinosad in human plasma and urine have already been evaluated for the 91/414/EEC submission and are included.	Official use only
	As described in the "Guidance Document on How to utilize PPP dossiers/monograph" of 21 November 2003 the evaluation of the CA from the PPP monograph (Vol. 3 / Annex B) is used. The methods have been evaluated in the 91/414/EC Draft Assessment Report on Spinosad of February 2001 in section Spinosadvol3B5 – Annex B – PCP and Methods Section. No further information is given in the addendum of June 2002 and of May 2005. The full 91/414/EEC DAR and its addenda are enclosed in the "other documentation" section as described Document I.1 – Application form, point 6.9.	

Below is an unchanged copy of the relevant parts of the 91/414/EEC Spinosad Draft Assessment Report (DAR) written by the CA (CTB) and released in February 2001. Numbering as in the DAR remains unchanged.

B.5.4 Analytical methods (residue) for body fluids and tissues (Annex IIA 4.2.5; Annex IIIA 5.2)

Method for the determination of Spinosad in human plasma and urine

Residues of spinosad (spinosyns A and D) were determined with reversed phase HPLC with ¹³C,₃D₃ stable isotopes of factors A and D as internal standards.

Residues were determined in urine after filtration with a 0.2 µm filter and in human plasma after mixing with an equal volume acetonitrile followed by centrifugation at 300 rpm.

Quantification is made by HPLC with positive ionization-mass spectrometry (+ESI/MS) detection.

(OR76, Markham et al, 1999)

B.5.5 EVALUATION AND ASSESSMENT

Analytical methods (residue) for body fluids and tissues

No analytical methods were submitted for the determination of spinosad residues in animal products. In view of the fact that no residue intake by livestock animals is expected, no residue definition is proposed and thus no analytical methods for animal products are required.

Section IIA 4.3	Analytical Methods for the active substance and residues thereof in food or feedstuffs	
Annex Point IIIA, IV.1		
	JUSTIFICATION FOR NON-SUBMISSION OF DATA	Official use only
Other existing data []	Technically not feasible [] Scientifically unjustified []	
Limited exposure [x]	Other justification []	
Detailed justification:	The active ingredient is used as a biocide in a fly bait formulation for control of the housefly (<i>Musca domestica</i>) indoors in animal stables. The flybait will not be used on any food or feedingsstuff. Even though many methods have been developed for the 91/414/EC PPP use of spinosad in crops, these are not relevant for the biocidal application and are thus not submitted.	
Undertaking of intended data submission []		
	Evaluation by Competent Authorities	
	<i>Use separate "evaluation boxes" to provide transparency as to the comments and views submitted</i>	
	EVALUATION BY RAPPORTEUR MEMBER STATE	
Date	27 November 2006	
Evaluation of applicant's justification	<p>The active ingredient is used as biocide for control of housefly indoors in animal stables. Spinosad residues in foodstuffs of animal origin can be expected if livestock consumes the biocidal product, when this is scattered, sprayed or painted onto a surface within reach of the livestock or when livestock consumes feed sprayed with the biocidal product.</p> <p>The presence of spinosad residues should therefore be verified in food or feed from animal origin. Analytical methods for food or feed from animal origin have been submitted in document IIIB and are evaluated there.</p>	
Conclusion	No analytical methods are required for the determination of spinosad residues in food and feed from plant origin. Satisfactory analytical methodology for food/feed of animal origin is summarised in doc IIIB.
